TO: W. H. Clymer

I: ATTACHED HERETO IS A DESCRIPTION OF WHAT MAY BE AN INVENTION IN:

The use of ammonium bifluoride as a fluorinating agent for conversion of plutonium dioxide to a plutonium ammonium tetrafluoride double salt, which can be decomposed to plutonium tetrafluoride for subsequent reduction to metal.

II: THE NAME, TITLE OR POSITION, WORKS LOCATION, AND PERMANENT ADDRESS OF THE INVENTOR(S) IS:

Willis B. Tolley, Junior Engineer, Hanford Atomic Products Operation, General Electric Company, Richland, Washington.

Robert C. Smith, Chemist II, Hanford Atomic Products Operation, General Electric Company, Richland, Washington.

III: EVIDENCE AS TO WHEN AND WHERE THE INVENTION WAS MADE CAN BE FOUND IN THE FOLLOWING LISTED WRITTEN OR PICTORIAL MATERIAL (NOTEBOOK, FILE REPORTS OR DRAWINGS, ETC.):

HW-5515-T (Secret Notebook) p 115-118 - Willis B. Tolley.
HW-4541-T (Secret Notebook) p 15 - Robert C. Smith

IV: THE APPROXIMATE DATE OF THE FIRST ENTRY IN SAID WRITTEN OR PICTORIAL MATERIAL DESCRIBING OR SHOWING SAID INVENTION IS:

November 2, 1953 - Willis B. Tolley
November 14, 1951 - Robert C. Smith

DECLASSIFIED

This is a report of what may be an invention in the use of ammonium bifluoride for the preparation of a plutonium ammonium fluoride double salt which can be decomposed at low temperature to plutonium tetrafluoride for purposes of reduction to the metal. Ammonium bifluoride has been found to react with dry plutonium dioxide at 150 C to produce the plutonium (IV) ammonium fluoride double salt. This compound can be decomposed at 300 C to give a high grade plutonium tetrafluoride. The use of this reaction to produce a plutonium tetrafluoride which can be reduced to the metal may reduce considerably the corrosion now experienced during the fluorination with gaseous hydrogen fluoride in 234-5 operation.

In practice on a nominal twenty gram scale, the optimum method for the preparation of plutonium tetrafluoride by the reaction of plutonium dioxide with ammonium bifluoride has been found to be as follows: freshly precipitated plutonium (IV) oxalate is placed in a reaction vessel and dried in a stream of air at 125 to 150 C for one hour and the temperature raised to 300 C for two hours to decompose the plutonium (IV) oxalate to plutonium dioxide. Forty percent excess ammonium bifluoride is mixed with the plutonium dioxide and heated in a stream of argon for one hour at 150 C. The double salt, plutonium (IV) ammonium fluoride, which forms rapidly at 150 C is decomposed at 300 C for one and one-half hours under argon. The ammonium fluoride decomposition product is easily trapped while the plutonium remains in the reaction boat as an easily powdered tetrafluoride. The plutonium tetrafluoride is then dehydrated for two hours at 500 C. Since the temperature need never exceed 500 C while fluoride is present the corrosion to furnace equipment should be low.

Analyses have shown that the plutonium tetrafluorides prepared in this manner are approximately 95 percent converted from the dioxide. Preliminary investigations have indicated that they can be reduced with calcium using the bomb method with high yields on a twenty gram scale.
